/clone_lib="Vertor: Lambda 220; Seedlings were exposed either
to 100 gy gamma or 0.5, 1, 5, or 10 kJ/m2 UV irradiation.
Gamma-irradiated samples were harvested at 6, 12, 24 and
48 hours after treatment. UV-irradiated samples were
harvested 24 hours post-treatment. cDNA was prepared from
polyA+ enriched, pooled samples of equivalent amounts of
total RNA from each sample. The cDNA was directionally
ligated into the Uni-Zap XR vector (Stratagene) and
packaged using the Giagack III Gold packaging extracts.
Phagemids containing cDNA inserts were in vivo excised
from the recombinant Uni-Zap XR vector using Exassist
helper phage and the E. coll strain XLI-Blue MRF.
(Stratagene). Excised plasmids were plated using SOLR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Lycopersicon esculentum

```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MITO28.2 Mistidine-rich protein.

Plasmodium falciparum (malaria parasite P. falciparum)

Plasmodium falciparum

Eukaryota; Alveolata; Apicomplexa; Haemosporida; Plasmodium.

1 (bases 1 to 2758)

Lenstra,R., d'Auriol,L., Andrieu,B., Le Bras,J. and Galibert,F.

Cloning and sequencing of Plasmodium falciparum DNA fragments

Containing repetitive regions potentially coding for histidine-rich

proteins: identification of two overlapping reading frames

Blochem. Blophys. Res. Commun. 146 (1), 368-377 (1987)

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 1, Apr

48 hours after treatment. UV-irradiated samples were harvested 24 hours post-treatment. CDNA was prepared from polyA+ enriched, pooled samples of equivalent amounts of total RNA from each sample. The CDNA was directionally ligated into the Uni-Zap XR vector (Stratagene) and packaged using the Gigapack III Gold packaging extracts. Phagemids containing CDNA inserts were in vivo excised from the recombinant Uni-Zap XR vector using ExAssist helper phage and the E. coli strain XLI-Blue MRF' (Stratagene). Excised plasmids were plated using SOLR

Genome. 12, 673-677 (2001)
Normalization and subtraction of cap-trapper-selected cDNAs to prepare full-length cDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)
RIKEN integrated sequence analysis (RISA) system--384-format sequencing pipeline with 384 multicapillary sequencer. Genome Res. 10 (11), 1757-1771 (2000)
Computer-based methods for the mouse full-length cDNA encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001) cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN.

/note="Vector: Lambda_Zap; Seedlings were exposed either
to 100 gy gamma or 0.5, 1, 5, or 10 kJ/m2 UV irradiation.
Gamma-irradiated samples were harvested at 6, 12, 24 and
48 hours after treatment. UV-irradiated samples were
polyk+ enriched, pooled sample of equivalent amounts of
total RNA from each sample. The cDNA was directionally
ligated into the Uni-Zap Xx vector (Stratagene) and
packaged using the digapack III Gold packaging extracts.
Phagemids containing-CDNA inserts were in vivo excised
from the recombinant Uni-Zap Xx vector using ExAssist
helper phage and the E. coli strain XLI-Blue MRF'
(Stratagene). Excised plasmids were plated using SOLR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Expropersion esculentum

Sequence 18, Application US/08021667A

Patent No. 5434049

GENERAL INFORMATION:
APPLICANT: Okano, Kazunori
APPLICANT: Kambara, Hideki
TITLE OF INVENTION: POLYNUCLEOTIDE CAPTURING TIP AND
TITLE OF INVENTION: METHOD USING SAME
NUMBER OF SEQUENCES: 18

CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 22.4; DB 1; Length 201; Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1, All

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 10
US-09-233-493-15
US-09-233-493-15

Sequence 15, Application US/09233493

Patent No. 6143557

GENERAL INFORMATION:

APPLICANT: Harsch, Michael A.

TITLE OF INVENTION: Recombinational Cloning Using Engineered

TITLE OF INVENTION: Recombination Sites
                                                                                                                                                                                                                                                                                                                                                                                               CUCNAIRS: USA,

This invention describes a novel sequence-specific recombination (SSR) of DNA in a eukaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (int) to effect SSR. The invention also describes (1) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 24 BP; 5 A; 3 C; 5 G; 11 T; 0 other;

Sequence-specific recombination of DNA in eukaryotes, useful particularly for somatic cell gene therapy, uses an integrase to effect recombination between att sites -

Example 1; Page 8; 24pp; German.

This invention describes a novel sequence-specific recombination (SSR) of DNA in a eukaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (int) to effect SSR. The invention also describes (I) a mucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy it derivatives. The method is applied more generally for gene theraper to animals or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        οŧ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA in a eukaryotic cell, comprising introducing two DNA sequences (I, into a cell, using an integrase (Int) to effect SSR. The invention also describes (1) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence-specific recombination of DNA in eukaryotes, useful particularly for somatic cell gene therapy, uses an integrase to effect recombination between att sites -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                          This invention describes a novel sequence-specific recombination (SSR) of
                                                                                                                                                                                                                                                                                                 DNA in a enkaryotic cell, conversing introducing two DNA sequences (1, 11) into a cell, using an integrase (Int) to effect SSR. The invention also describes (1) a mucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences.
                                                                                                                                                                                                                              Sequence-specific recombination of DNA in eukaryotes, useful particularly for somatic cell gene therapy, uses an integrase to effect recombination between att sites -

The att sequences are recognised by the recombination protein lambda integrase (Int). The invention is a new method of producing a population of hybrid nucleic acids comprising mixing at least a first population of hybrid nucleic acids comprising one or more recombination sites with at least one target nucleic acids comprising one or more recombination sites and causing some or all of the nucleic acids to recombine with all or some of the target nucleic acids. The method is useful for producing a population of hybrid nucleic acids which may be the same or different. The nucleic acids may be used to express therapeutic proteins or different acids may be used to create novel fusion proteins by expressing different sequences linked to each other. The method allows simultaneous cloning of
                                                                                                                                                                                                                                                                                              Producing hybrid nucleic acids, useful for expressing novel therapeutic polypeptides, by mixing the same or different nucleic acids having one or more recombination sites in the presence of recombination proteins,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence-specific recombination; SSR; integrase; gene therapy; somatic;

This invention describes a novel sequence-specific recombination (SSR) of DNA in a eukaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (Int) to effect SSR. The invention also describes (I) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in sommatic gene therapy its derivatives. The method is applied more generally for gene transfer to animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences.
               DNA in eukaryotes, useful
therapy, uses an integrase to effect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inserting a population of nucleic acids into a second target molecule for selecting and isolating nucleic acid molecules by mixing the second population of nucleic acid with a second target nucleic acid.
                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The detection chip
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequences given in AAO50309-26 are probes which were used on a chip for capturing a number of target polynuclectides. A group of these probes may be attached on cells which form part of a single chip. The oligonuclectides to be detected are labelled and are complementary to the set of capture probes used. The detection ch may be used to detect a number of different polynuclectides
                                                                                                                                                                                                                                                                                                                                                                                Chip for capturing polynucleotide - has several different complementary probes fixed on cells at different sites on single

```

The invention relates to inserting a population of nucleic acids into a second target molecule. The method involves (a) mixing a first population of nucleic acid comprising one or more recombination sites with a target nucleic acid; (b) causing some or all of the nucleic acid molecules of the first population to recombine with the first target nucleic acid of nucleic acid with a second population of nucleic acid with a second target nucleic acid, and (d) causing some or all of the nucleic acid molecules of the second population to recombine with some or all of the second target nucleic acid molecules to

DNA in a eukaryotic cell, comprising introducing two DNA sequences (1, 11) into a cell, using an integrase (Int) to effect SSR. The invention also describes (1) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                               invention describes a novel sequence-specific recombination (SSR) of

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits sites, where an att site is heterologous to the chromosome ambod-integrase. Also described: (I) a platform artificial chromosome expression system (ACes) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing a ransgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid mediated transfection, marcopojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACes comprising random portions of a genome. ACC44612 to ACC44732 and ABP96650 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Plant artificial chromosome; PAC; transgenic plant; vaccine;

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods for delivery of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, ENRA, rDNA, structural proteins, marker proteins, isgands, receptors, ribozymes, therapeutic proteins, and product proteins, lagands, receptors, ribozymes, blood factors, antigens, hormones, ovtokines, growth factors, antigeds, or a product that provides for resistance to diseases, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that provides an agronomically important trait in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid optionally encodes a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid alterial acid acid is contained within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (MAC). This producing plant artificial chromosomes of the invention.
                                                                                                                                                                                                                                       Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic nucleic acids -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 282 BP; 79 A; 49 C; 39 G; 115 T; 0 other;

Removing a part of a transgene which has been integrated into a genome comprises inducing intrachromosomal homologous recombination between the attachment P regions of bacteriophage lambda flanking the transgene

8; Fig 3D; 25pp; English. Claim

The present invention describes a method of removing a transgene marker by flanking the transgene with a bacteriophage lambda attachment P (attp) region and inducing homologous recombination between attP regions so that the transgene is removed. This is useful in the production of transgenic plants with less risk of inter-species transmission of marker genes, which often encode proteins associated with, for example, herbicide and antiblotic resistance. The present sequence is the attP coding region.

Novel genes and polypeptides, useful for treating conditions related to a deficiency in nIEG responsiveness to a stimulus

Claim 1; Page 114-115; 134pp; English.

This sequence represents rat neuronal immediate early gene (IEG) cDNA clone R280. An IEG is a gene whose expression is rapidly increased immediately following a stimulus e.g., neuronal stimulation. Such neuronal IEGs have been found to encode a variety of proteins, including transcription factors, cycoskeletal proteins, growth factors and metabolic enzymes, as well as proteins involved in signal RESULT 13

transduction. The identification of neuronal IEGs and the proteins they encode may provide important information about the function of neurons in for scample. Learning, memory, synaptic transmission, colerance and neuronal plasticity. Neuronal IEGs, neuronal IEG protein products, cells expressing neuronal IEGs and antibodies against neuronal IEG proteins can be used to treat an animal with a deficiency in neuronal IEG minimised. The deficiency way be a reduced or elevated level of expression of an IEG. The neuronal stimulus comprises a maximal electroconvulsive seizure and its effects influence learning or memory. The IESs and protein products are useful in identifying compounds that modulate the expression or activity of IEG nucleic acids or proteins, respectively. \$

permits site-directed integration in the presence of lambda-integrase, useful for site-specific recombination-directed integration of DNA of eukaryotic chromosome comprising one or many att sites which interest Novel

Example 3; Page 244-245; 272pp; English.

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is hererologous to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (1) a platform artificial chromosome expression system (Aces) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (M1) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (M1) is useful for 

```
introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACes. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection by a carrier system, microinfoction, microcell fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of Aces comprising random portions of a genome. Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic nucleic acids

Example 19; Page 255-256; 269pp; English.

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods for delivery of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, tRNA, back, structural proteins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and blopharmaceutical proteins, vaccines, blood factors, antigens, hormones, 

```
cytokines, growth factors, antibodies, or a product that provides for resistance to diseases, insects, herbicides, or stress in a plant. The heterologous nuclaic acid optionally encodes a product that provides an agronomically important trait in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (YAC). This polynucleotide sequence represents the DNA of a plasmid used in the method of the invention.

                                                                                                                                   This invention describes a novel sequence-specific recombination (SSR) of DNA in a eukaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (Int) to effect SSR. The invention also describes (I) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in sometic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel sequence-specific recombination (SSR) of DNA in a eukaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (Int) to effect SSR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel sequence-specific recombination (SSR) of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA in a entaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (Int) to effect SSR. The invention also describes (I) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene, or its derivatives, but can be applied more generally for gene transfer to animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence-specific recombination of DNA in eukaryotes, useful particularly for somatic cell gene therapy, uses an integrase to effect recombination between att sites -
                                                                                                                                                                 Sequence-specific recombination, SSR, integrase, gene therapy; somatic, targeted integration, attP*, ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        transfer to animal or plant cells. The method is simple and controllable and provides stable and targeted integration of selected DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

This invention describes a novel sequence-specific recombination (SSR) of
                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA in a eukaryotic cell, comprising introducing two DNA sequences (1, 11) into a cell, using an integrase (int) to effect SSR. The invention also describes (1, a mucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant calls the method is simple and controllable, and provides stable and targeted integration of selected DNA sequences.
                                                          Sequence-specific recombination, SSR; integrase; gene therapy; somatic; targeted integration; attP*; ds.
                                                                                                                                                                                                                                                                                                                                           Sequence-specific recombination of DNA in eukaryotes, useful particularly for somatic cell gene therapy, uses an integrase to effect recombination between att sites -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bacteriophage lambda; recombination; att site; PCR primer; lambda Int;

AASO6174-AASO6322 represent Bacteriophage lambda att recombination site nucleic acid sequences, and PCR primers of the invention. The att sequences are recognised by the recombination protein lambda att sequences are recognised by the recombination protein lambda of hybrid nucleic acids comprising mixing at least a first population of hybrid nucleic acids comprising mixing at least a first population of one target nucleic acid comprising one or more recombination sites with at least coursing some or all of the nucleic acids to recombine with all or some of hybrid nucleic acids. The method is useful for producing a population of the target nucleic acids which may be the same or different. The nucleic acids may be used to express therapeutic proteins or peptides and they may also be used to create novel fusion proteins by expressing different sequences linked to each other. The method allows simultaneous cloning of
                                                                                                                                                                                                                                                     therapeutic
                                                                                                                                                                                                                                          Producing hybrid nucleic acids, useful for expressing novel therapeutic polypeptides, by mixing the same or different nucleic acids having one or more recombination sites in the presence of recombination proteins,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô

DIA in a enkaryotic cell, comprising introducing two DNA sequences (1, 11) into a cell, using an integrase (Int) to effect SSR. The invention also describes (1) a mucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences.
                       Sequence-specific recombination of DNA in eukaryotes, useful particularly for somatic cell gene therapy, uses an integrase to effect recombination between att sites -
                                                                                                                                                                              sequence-specific recombination (SSR)

The invention relates to inserting a population of nucleic acids into a second target molecule. The method involves (a) mixing a first population of nucleic acid comprising one or more recombination sites with a target nucleic acid, (b) causing some or all of the nucleic acid molecules of the first population to recombine with the first target nucleic acid molecules to form a second population, (c) mixing the second population of nucleic acid with a second target nucleic acid and (d) causing some or all of the second population to recombine with some or all of the second target nucleic acid molecules to 

```
ö
form a third population of nucleic acid. The method is useful for selecting and isolating nucleic acid molecules. Sequences ABZ58727-762 represent att recombination site sequences used in the method of the

A group of these probes may be attached on cells which form part of a single chip. The oligonucleotides to be detected are labelled and are complementary to the set of capture probes used. The detection chip may be used to detect a number of different polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequences given in AAQ50309-26 are probes which were used on

This invention describes a novel sequence-specific recombination (SSR) of DNA in a eukaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (Int) to effect SSR. The invention also describes (I) a nucleic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives, plus a therapeutic gene, or its derivatives. The method is particularly used in sometic gene therapy in humans and animals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chromosome-based platform, artificial chromosome; eukaryotic chromosome; att site; integrase; recombinase; ACes; gene therapy; transgenic animal; platform artificial chromosome expression system; gene; ds.

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits sites thered integration in the presence of chromosome. Also described: (I) a platform artificial chromosome expression system (Accs) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (M1) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (M1) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an Accs. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection mammal) by introducing (II) by cell fusion, lipid-mediated transfection colly preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of Aces comprising readoms portions of a genome. ACC44612 exemplification of the present invention.

The invention is a lover methods for targeting insertion of heterologous DNA into plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods for delivery of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product the proteins, and proteins, and proteins, and proteins, and proteins, and proteins, inserts. AINA, structural proteins, and proteins, proteins, and proteins, vaccines, bloopharmaceutical proteins, vaccines, bloopharmaceutical proteins, vaccines, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistance to diseases, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that provides an agronomically important trait in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The heteroschogous nucleic acid is contained within a bacterial artificial heteroscome (BAC) or a yeast artificial chromosome (MAC). This producing plant artificial chromosomes of the invention.
                                                                                                                                                                                                                                                                has one or more repeat
                                                                                                                                                                                                                                                                                                                                                                                                                      invention relates to a novel method for producing plant artificial

Removing a part of a transgene which has been integrated into a genome comprises inducing intrachromosomal homologous recombination between the attachment P regions of bacteriophage lambda flanking the transgene

Claim 8; Fig 3D; 25pp; English

The present invention describes a method of removing a transgene marker by flanking the transgene with a bacteriophage lambda attachment P (attP) region and inducing homologous recombination between attP regions so that the transgene is removed. This is useful in the production of transgenic plants with less risk of inter-species transmission of marker genes, which often encode proteins associated with, for example, herbicide and antibiotic resistance. The present sequence is the attP coding region.

treating conditions related stimulus -Novel genes and polypeptides, useful for a deficiency in nIEG responsiveness to a

Claim 1; Page 114-115; 134pp; English.

This sequence represents rat neuronal immediate early gene (IEG) cDNA clone R280. An IEG is a gene whose expression is rapidly increased immediately following a stimulus e.g., neuronal stimulation. Such neuronal IEGs have been found to encode a variety of proteins, including transcription factors, cytoskeleral proteins, growth factors and metabolic enzymes, as well as proteins involved in signal

~

```
encode may provide important information about the function of neurons in, for example, learning, memory, synaptic transmission, tolerance and neuronal plasticity. Neuronal IEGs, neuronal IEG protein products, cells expressing neuronal IEGs and antibodies against neuronal IEG proteins can be used to treat an animal with a deficiency in neuronal IEG minimised. The deficiency may be a reduced or elevated level of expression of an IEG. The neuronal stimulus comprises a maximal electroconvulsive seizure and its effects influence learning or memory. The IEGs and protein products are useful in identifying compounds that modulate the expression or activity of IEG nucleic acids or
The identification of neuronal IEGs and the proteins they

Novel eukaryotic chromosome comprising one or many att sites which permits site-directed integration in the presence of lambda-integrase, useful for site-specific recombination-directed integration of DNA of interest

Example 3; Page 244-245; 272pp; English.

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome expression system (ACes) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous mucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for ACC44716/C

introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an ACse. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection by a carrier system, microinjection, microcell fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for the ACC44712 and ABP96650 to APB96657 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                         Gaps

Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic nucleic acids -Plant artificial chromosome; PAC; transgenic plant; vaccine; blood factor; herbicide; stress; agronomical; nutrient quality; bacterial artificial chromosome; BAC; yeast artificial chromosome; YAC; (CHRO-) CHROMOS MOLECULAR SYSTEMS INC щ Perkins 10-MAY-2002; 2002WO-US17451. 30-MAY-2001; 2001US-294687P. 04-JUN-2001; 2001US-296329P. Perez C, Fabijanski SF, AGRISOMA INC WPI; 2003-140436/13. WO200296923-A1. Unidentified. 05-DEC-2002. AGRI-) 

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods for delivery of plant chromosome (PAC) is useful for producing a transgenic plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, tRNA, rDNA, structural proteins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and biopharmacceutical proteins, vaccines, blood factors, antigens, hormones,

cytokines, growth factors, antibodies, or a product that provides for resistance to diseases, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that provides an agronomically important trait in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (YAC). This polynucleotide sequence represents the DNA of a plasmid used in the method of the invention.
